Problem 1: BUGGY CODE

```
# code
class Person:

    # Constructor
    def __init__(self, name, id):
        self.name = name
        self.id = id

    # To check if this person is an employee
    def Display(self):
        print(self.name, self.id)

class Emp(Person):

    def __init__(self, name, id):
        self.name_ = name

    def Print(self):
        print("Emp class called")

Emp_details = Emp("Mayank", 103)

# calling parent class function
Emp_details.name_, Emp_details.name
```

Fixing the above problem with Super in Python

Problem 2: Write a Python program to find Anagram Check

Problem 3: Write a Python program to check for Armstrong Number.

Problem 4: Deal with Classes and Objects

Scenario: Car dealership's inventory management system

Task-1. You are tasked with creating a Python program to represent vehicles using a class. Each car should have attributes for maximum speed and mileage.

Task-2. Update the class with the default color for all vehicles," white".

Task-3. Additionally, you need to create methods in the Vehicle class to assign seating capacity to a vehicle.

Task-4. Create a method to display all the properties of an object of the class.

Task-5. Additionally, you need to create two objects of the Vehicle class object that should have a max speed of 200kmph and mileage of 20kmpl with five seating capacities, and another car object should have a max speed of 180kmph and mileage of 25kmpl with four seating capacities.
